Summary

Unity Developer with hands-on experience building gameplay systems, mechanics, and UI in C# across 2D and 3D projects shipped to Google Play. Strong foundation in object-oriented programming, data-driven system design, debugging, and performance optimization, with a track record of taking design specs from concept to stable, playable Unity builds.

Professional Work Experience

Junior Game Designer - Pendamaze Studio

April 2026 – Present

- Implemented and tuned core Faucet/Sink economy systems directly in Unity, driving tier-based upgrade costs (scaling to 704 by tier 15) and reward multipliers (including 1.5x completion bonuses) off data-driven parameters to support a consistent progression curve.
- Built the onboarding flow and level layouts for the first 10 levels in the Unity Editor, structuring spatial pacing and mid-game difficulty curves for a seamless tutorial ramp-up.
- Reverse-engineered mechanics and systems from 5 competing titles, documenting findings in a technical Game Design Document (GDD) that informed implementation priorities.
- Worked cross-functionally with an external art team, specifying environment asset requirements and tracking stage-by-stage integration into the Unity project.

Unity Game Developer Intern - Datamonk

July 2025 – October 2025

- Implemented core gameplay systems and player progression logic in Unity using C#, applying object-oriented programming principles and iterative debugging to deliver stable, playable builds for 2D and 3D games deployed on Google Play Store.
- Collaborated with designers and artists using Git to integrate gameplay systems, UI components, and assets into production-ready builds.
- Debugged, refactored, and optimized gameplay code to improve performance and runtime stability.

Education

Poornima University, B.Tech in Computer Engineering (Game Technology) | CGPA: 8.25

Aug 2023 – Present

- **Coursework:** C Programming, C#, Java (OOP), Computer Networking, RDBMS, Data Structures & Algorithms, Unity Engine, Autodesk Maya

Projects

Alien Invader | C#, Unity 6

- Developed gameplay systems for movement, combat, and object lifecycle management in a 2.5D arcade shooter, focusing on efficient update loops and collision handling for responsive gameplay.
- Implemented border wraparound, bullet fire delay, and object culling to optimize performance.

Monkey Jump | C#, Unity 6, Aseprite

- Implemented player movement physics, camera systems, and a charged jump mechanic using object-oriented C# design in a 2D platforming environment.
- Built a high score system, cinematics, smooth camera follow, and touch-based UI controls to improve accessibility and feel.

Full Throttle | C#, Unity 6, Blender 3D

- Built procedural world generation and gyroscopic/touch input-handling systems in Unity, implementing reusable C# components for an infinite-runner loop.
- Debugged and optimized performance issues related to continuous runtime level generation.

Skills

Programming & Engineering: C, C#, Java, Object-Oriented Programming (OOP), Data Structures & Algorithms, Debugging & Code Refactoring, Performance Optimization, Version Control (Git)

Tools & Engine: Unity 6, Visual Studio, Aseprite, Blender 3D, Autodesk Maya

Game Design Skills: Gameplay Mechanics Design, Prototyping & Iteration, UI/UX for Games, Cross-Team Collaboration
